

Short reflection

What I learnt:

This is my first Python assignment and it has taught a lot of things and enabled me to gain a much better understanding of everything I have learnt in class for the past seven weeks. First I learnt what a class and an object is. I can term a class like a blank form or a blueprint. In my project the class I created is called Assignmentform. This is just an empty form that has sections for subject, title, marks, max marks, date and type. An object is when I fill that form with real information. So each time I create a homework or an exam, I am actually making a real object from the class.

My lessons did not end with class and object only, I also learnt about `__init__` and `self`. Whenever I create a new object, `__init__` runs automatically and puts the information inside the object. And the word `self` means a specific object. At first I was confused and I asked the facilitator if it is only the word "self" that is allowed. And he explained that self is not really a special keyword, it is just a strong convention so that other programmers can understand my code easily. So, I can use any other word but for my code to be easily understood I ought to follow this. I also learnt about inheritance, `super()`, `float()` to change text to number, for and while loops for the menu and how to check if marks are bigger than max marks so the program does not accept wrong data. And from Git I learn to commit small steps many times and push and not one big dump.

Challenges I faced

The biggest challenge was VS Code. Sometimes the file becomes read-only and I cannot type input. I reached out a lot of times to the facilitator who guided me and explained things in a way that became more understandable to me. I had to fix the python environment and a fellow classmate helped with this. Also the red exclamation mark on [main.py](#) confused me at first but the facilitator explained it means I have to commit the changes. I also did not get a filter easily at first so I had to skip it but after reaching out to the facilitator who provided me with a GeeksforGeeks link and it helped me. This is my first time with programming and Git so I was not sure if every step I committed was correct but thankfully I made it. Time was also a challenge because I had to juggle my internship duties with class and creating time to finish up assignments.

How I will improve if more time

I will save the assignments to a file so data does not disappear when I close the program. I will add more validation like no negative marks and even check the date format. I will make the menu look nicer and add a way to edit or delete assignments. Maybe write small tests so I can check code without running everything by hand.

Overall, this project taught me a lot even with the problems I faced. The errors I encountered and the help from the facilitator helped me understand.
